Gang Yang Résumé

Personal Info

> 30 years， male
> 2013 graduated from LiaoNing University
> major in Computer Science and Technology
> 13889471040@126.com

Skill

> Linux， Oracle/DB2， ETL， Java， devops， WebSphere

Experience

2013-2015 BeiJing DongHua Co.

> java developer+Oracle DBA
> ibatis,struts2,spring， Oracle database maintain,**special recovery**

2015-now IBM Co.(3 years contractor& two years regular)

1. Linux maintains
2. DB2:backup,migration,**special recovery**,monitor and optimize
3. ETL:Datastage daily development
4. Java:springBoot+spring+mybatis development
5. devops:jenkins+pipeline+docker setup deploying process from github to cloud
6. WebSphere:solute the issues from java developer

Project Experience

- **IBV:DB2+cloud+jenkins**
  date：2018-2020
  desc:it is CIO portal web site， issuing CIO content
  duty:maintain db2 datasource , set up process of devops and pushing message to slack , sync data in 5 minutes by shell.We met many issues in daily development， of course ,also learning many .It is first time that we adopt jenkins+cloud， which causes many unexpected blocker such as ant-compile. it is a long tortuous way.Finally we integrate nodejs& jcoco into jenkins,automatically deploying , app-scan and development driven by test to achieve "agile goal"

- **RIQ : DB2+java+DataStage**
  date:2018-now
  desc:extracting data from external data-source and load to project database to demonstrate to sponsor
  duty:In this project ,I fetch data from external data-source and sync data from product to uat environment periodically by shell. I did the datastage job :extract ,transfer and load into our database. I encrypted the database and install the certificate for GDPR protocol.Document every steps and distribute to other teams. Once i restored database file with no backup images because someone damage the log file and db can't be opened in normal way . In this project , i optimize the prior sync process from 1 hour to 5 minutes .I fixed prior issue

- **Innovation：ELK+java+shell**
  date:2019
  desc：it is our innovation project for adopting kinds of new tech.
  duty:leading two developer for a monitoring system, java calls shell to collect usage of cpu/memory/disk and pushing json data to ELK service and store in mysql simultaneously . Front end display data in chart to the team. All deploying process is automatic.

- **InBank：Oracle+ibatis+struts2**
  date:2013-2014
  desc：internal banking system
  duty：At first i handle loan and approvement module , set up correct loan process and approvement process based on business logic. Later on , someone damaged the system file and deleted redo log and i happened to use BBED before , which can be found in oracle 10g only so I inspected into data block and updated parameter in block then open the database by force. After that i do the DBA job,including backup via rman,rehearsing recover& restore monthly and migration to asm . Write document to conclude daily work.

self-assessment

I have been this area for almost 8 years from back end to server , from docker to cognos. I realize that reading official document is the best way to learn new skill and I do enjoy adopting new technic and improving my project a little bit.Once I helped a developer to fix a problem which frustrated him for one month and I sensed of fulfillment.
